## **1.0. INTRODUCTION**

The Montana Department of Fish, Wildlife and Parks have conducted statewide angling mail surveys for more than 50 years. Bishop (1959, 1960 & 1961) conducted the first recorded mail survey of fishing pressure on a statewide basis for Montana. He found that residents fished 1,323,129 angler days, nonresident season license holders fished 60,632 angler days, and nonresident 6-day permit holders fished 40,933 angler days for the 1958 season. In 1959 residents fished 1,345,000 angler days, nonresident season license holders fished 54,000 angler days, and nonresident 6-day permit holders fished 121,000 angler days. In 1960 the third annual survey was conducted and residents fished 1,356,000 angler days, nonresident season license holders fished 53,000 angler days, and nonresident 7-day permit holders fished 112,000 angler days.

In 1968 Holton (1970) again initiated the statewide angling pressure mail survey. He found residents had fished 1,519,126 angler days, nonresident season license holders fished 69,653 angler days, and nonresident 6-day permit holders fished 161,772 angler days. Holton (1971) conducted another statewide survey for the 1969 license year. No results were reported because it was felt they were too high due to sampling problems.

In 1975, Gaffney (unpublished data) conducted a statewide survey of angling pressure by mail. He found residents fished a total of 2,314,030 angler days and nonresidents 508,034 angler days for a statewide total of 2,822,093 angler days. An attempt was made to continue that statewide survey in 1976 using the 1975 mailing lists. This did not provide adequate samples for nonresidents, so only resident pressure was obtained.

The surveys were started again in 1982 and run for four consecutive years (McFarland, 1989). The statewide angling pressure ranged from 2,197,402 to 2,723,713 angler days. In 1986 the surveys were again canceled for lack of funding.

In 1989, the Montana Legislature approved funding for an "Enhanced Survey of Angling Pressure". The funding was such that the survey was to be conducted every other year. In March 1989, the statewide angling use mail survey was again re-initiated, and has been conducted on a biannual basis since that time. The statewide angling pressure for the 1989 fishing year was estimated at 2,336,085 angler days (McFarland, 1991). From 1991 through 2011 the statewide angling use has varied from 2.2 million to 3.36 million angler days. In 2011 the statewide angling use was estimated at 2,802,149 angling days.

## **2.0. METHODS**

The 2011 statewide angling mail pressure survey was conducted during the license year beginning March, 2011 and ending February, 2012. The methods used by R. McFarland for surveys conducted from 1989 through 2009 provided the framework for the 2011 survey.

Samples were drawn from the Department's Automated Licensing System (ALS) on the first day of each month. All anglers who purchased a two or ten day license valid for use in the previous month as well as all anglers who purchased or held a season fishing license valid for use in the previous month were included in the eligible angler population. A computer program was written in ORACLE to create five populations of anglers from which to draw samples. A resident season population, a resident 2-day population, a nonresident season population, a nonresident 2-day population and a nonresident 10-day population were created each month. The five populations of anglers drawn from the ALS database are:

1. NonResident 2-day license: enables the nonresident angler to fish for two consecutive days of their choice. Anglers may purchase as many two-day licenses as they want.
2. NonResident 10-day license: enables the nonresident angler to fish for 10 consecutive days of fishing. Anglers may purchase as many ten-day licenses as they want.
3. NonResident Season license includes:
  - combo license - combines a nonresident conservation license and seasonal fishing license.
  - seasonal license
  - deer combo license - includes a deer tag and a fishing license.
  - big game combo - includes a conservation license, an elk tag, a deer "A" tag, a black bear tag, a fishing license and an upland game bird license.
4. Resident 2-day license: valid for 2 consecutive days at a reduced cost.
5. Resident Season license includes:
  - season license
  - combo license - combines a season fishing license and a conservation license
  - sportsman's license - provides a deer "A" tag, elk tag, optional bear tag, conservation license, a game bird stamp and a fishing license
  - "senior" license - 62 years of age and older
  - "youth" license - ages 12 and 14
  - disabled license - certified as permanently and substantially disabled

An ACCESS table was used to pull a random sample from each population. Sampling was done on a monthly-stratified basis (Table 1). The amount pulled from each population was proportionally allocated to the angling pressure each population exerted from previous surveys. This proportion remained constant throughout all sampling periods for the past several surveys. The 2011 survey used these same sample sizes.

The sample from each population was assigned wave information and sequential serial numbers. The database of names and addresses were run through Pitney-Bowes SmartMailer 7 software program to validate addresses and assign correct 4 digit zip code extensions. Only addresses that passed the mail validation were included in the final sample. This helped reduce the number of non-deliverable surveys. An ACCESS report was written to export the monthly sample data

into a spreadsheet for mail merging with the survey WORD document. The merged file contained a single page for each angler included in the sample. This merged file and a separate map file were sent to Print & Mail Services in Helena, MT where the survey was printed (two-sided), stuffed into envelopes and mailed via standard mail. Print & Mail Services handle a large volume of mail every month so we were able to take advantage of reduced mailing costs.

Table 1. Period of time covered for waves for the 2011-12 statewide angling survey.	
Wave	Time Period covered

11	January '12
12	February

The 2007 Statewide Angling Use Survey (McFarland, 2009) indicated that residents provide approximately 75% of angling pressure, therefore sampling was done on a 75/25 split between residents and nonresidents (i.e. proportional allocation). Actual numbers sent varied slightly from wave to wave (Table 2). For the "summer" waves 11,200 residents and nonresidents were sampled early in the survey. In the "winter" the rate dropped to 5,600 residents and nonresidents. Since waves 1 and 2 had fewer license holders from which to sample, these two waves were sampled at a less intense level.

A single questionnaire was used for all groups. The questionnaire (see Section 7.0 for an example), included questions on: what water was fished; nearest landmark, town, or county; section of stream or river fished (taken from map on back of questionnaire); date fishing occurred; number of days fished; rate the level of crowding on a scale of 1 = not at all crowded to 5 = very crowded; number of other people they saw recreating on this water; and to rate their fishing experience on a scale of 1 = poor to 5 = excellent; the one fish species for which they were primarily fishing; whether most of the angler's fishing was by shore, boat, both or ice. A question on the number of days the angler fished with an outfitter was added this year.

To ease the sorting process different colored forms were used for each wave and also for initial and remail mailings.

Table 2. Number of questionnaires sent for each wave by residency for 2011.

Wave	Mailed		Useable		Returns		Return Rate	
	Res	Nonres	Res	Nonres	Res	Nonres	Percentage	Res Nonres
1	299	101	293	95	173	48	59.0	50.5
2	4200	1400	3982	1289	2421	697	60.8	54.1
3	8401	2798	7922	2563	4593	1385	58.0	54.0
4	8401	2799	8095	2663	4521	1488	55.8	55.9
5	8400	2800	7786	2552	4066	1412	52.2	55.3
6	8401	2799	7671	2547	4032	1385	52.6	54.4
7	8399	2801	7619	2551	4148	1528	54.4	59.9
8	4201	1399	3727	1272	2226	776	59.7	61.0
9	4203	1397	3787	1279	2214	723	58.5	56.5
10	4203	1397	3737	1216	2212	681	59.2	56.0
11	4206	1256	3746	1095	2212	591	59.0	54.0
12	4201	1235	3829	1092	2310	572	60.3	52.4

Surveys were mailed standard pre-sort for all the waves. This saved monetarily over regular first class postage.

Remail questionnaires were mailed to those individuals who had not yet responded, from three to four weeks after the initial mailing. Returns for each wave were monitored and when they slowed down to a few each day the remail was sent. Included in the remail were an explanation, (see Section 7.0 for examples), a duplicate questionnaire and a return envelope. Returns were grouped and counted according to type of license, wave and mailing (initial or remail).

Phone surveys have been used in the past for the purpose of determining nonresponse bias associated with the mail surveys and making adjustments to pressure estimates accordingly. The most recent phone survey was conducted in 1997. It showed no statistically significant difference in response rate between the phone and mail surveys. No phone surveys were conducted in 2011, so it was assumed that there was no nonresponse bias and no adjustment necessary.

Returned questionnaires were sorted into those that had fished in Montana during the period in question and those that had not. The "yes" respondents were keyed into an Access database using forms and lookup fields. A record was entered for each stream or lake fished. Both the stream or lake name and the nearest town or county were entered for each record. This data was used to identify a specific watercode for each record. Edits were run to correct invalid water codes and data out of normal ranges.

FORTRAN computer programs written by R. McFarland for the 2009 survey were used to analyze the data, calculate fishing pressure and standard errors, and to calculate the angler satisfaction levels. Estimates were made for individual waters based upon the formula:

$$P_j = \sum_{i=1}^n \left[ \frac{E_{ij} * D_{ij}}{R_{ij}} \right] * A_{ij}$$

where  $P_j$  = Pressure for an individual water by the  $j^{\text{th}}$  residency

$E_{ij}$  = Number of eligible anglers for the  $i^{\text{th}}$  wave and  $j^{\text{th}}$  residency

$D_{ij}$  = Days fished that particular water for the  $i^{\text{th}}$  wave and  $j^{\text{th}}$  wave

$R_{ij}$  = Number of respondents from the survey for the  $i^{\text{th}}$  wave and  $j^{\text{th}}$  residency

$A_{ij}$  = Adjustment factor for non-response for the  $i^{\text{th}}$  wave and  $j^{\text{th}}$  residency

$n$  = number of waves in the estimate year or season

$j$  = number of residency types (resident, nonresident, or total)

The variance was then calculated using:

$$VAR(P_j) = \sum_{i=1}^n \left[ \frac{E_{ij}^2 * VAR(D_{ij})}{R_{ij}} \right] * A_{ij}^2$$

Where  $P_j$ ,  $E_{ij}$ ,  $R_{ij}$ ,  $D_{ij}$ , and  $A_{ij}$  are the same as above.

Pressure estimates between waves and residency were assumed to be independent so variances were summed to obtain total variances. The square root of the variance was taken and this number was reported as the error for fishing pressure.

## **3.0. RESULTS**

### **3.1. ANNUAL (MARCH 2011-FEBRUARY 2012)**

#### **3.1.1. Angler Pressure Estimates**

Licensed anglers fishing on Montana waters exerted 2,802,149 angler days of pressure for the 2011 license year (Table 3). Residents accounted for 1,826,745 angler days (65.2%) and nonresidents made up the remaining 975,404 angler days (34.8%). Individual water estimates sorted alphabetically are given in Appendix A of this report.

The pressure distributed between Fish, Wildlife and Parks regions (Figure 1) emphasizes the cold-water fishery. Region 3 received the most angling pressure with 695,172 angler days (24.8%). Region 4 was next in order with 593,869 angler days (21.2%). Regions 1 and 2 were close with 430,467 (15.4%) and 456,943 (16.3%) angler days respectively. Region 5 was not far behind with 380,757 (13.6%) angler days. The warm-water regions of 6 and 7 were the lowest in pressure with 144,542 (5.2%) and 79,615 (2.8%) angler days respectively.

Angling in Montana in 2011 was directed toward trout. Waters were classified according the fish species the angler sought. The questionnaire asked the angler to report one fish species but up to two species were captured in entering the data. Species were classified into salmonid/nonsalmonid categories. The angling use was assigned proportionally. If only one species was listed the entire use was assigned to either salmonid or nonsalmonid depending on what species was listed. If two species were listed, the use was assigned to salmonid if both species were salmonid. If both species listed were nonsalmonid, the use was entirely assigned to nonsalmonid. If one species of each (salmonid and nonsalmonid) was listed, the use was split 50/50 between the two. If no species was listed the use was assigned according to the type of water assigned by the department in its water code for that water.

Salmonid waters accounted for 80.6% (2,259,715 angler days) of the statewide pressure while nonsalmonid waters accounted for 19.2% (537,673 angler days) of the pressure and undesignated waters accounted for less than 0.2% (4,762 angler days) of the pressure. An undesignated water is one that the angler did not specify a fish species being sought and the water fished was classified as undesignated and therefore could not be assigned a water type. Within salmonid waters, the streams received more pressure than the lakes, 67.0% versus 33.0%. The nonsalmonid lakes received more pressure (70.3%) than the nonsalmonid streams (29.7%).

Salmonid angling dominated the pressure in regions 1, 2, 3, 4, and 5. Regions 6 and 7 were predominately nonsalmonid angling (Chart 1, Table 3). Region 3 had the largest angling pressure for salmonid streams (548,819 angler days) and while region 4 had the largest pressure for salmonid lakes (203,582 angler days). Nonsalmonid stream fishing pressure was largest in region 7 (45,988 angler days), while the nonsalmonid lake angling pressure was largest in region 4 (123,882 angling days).

Table 3. - Angling pressure in angler days by region by water type for the 2011 angling year.

Residents (Chart 2) exerted the majority of angling pressure in 2011 in all regions but Region 3. The percent of angling pressure by residents for each region was: Region 1 – 75.2%, Region 2 – 67.1%, Region 3 – 47.4%, Region 4 – 80.2%, Region 5 – 51.5%, Region 6 – 82.9%, and Region 7 – 80.7%. August (wave 6) was, overall, the peak fishing period, while March (wave 1) was the least fished period during the year (Table 4). Both residents and nonresidents preferred to fish during August (wave 6). Both residents and nonresidents fished least in March (wave 1).

Angling pressure was summarized by the 22 major drainages within the state (Table 5). The lower Clark Fork River drainage contains the angling pressure from all the streams and lakes below the Bitterroot River, excluding the pressure from those waters contained in other drainages listed (Flathead, Kootenai, and Bitterroot). The upper Clark Fork River drainage, likewise, contains all the angling pressure for waters above the Bitterroot River drainage excluding the pressure for those drainages listed. The upper Flathead River drainage contains the South Fork Flathead River drainage and all waters above the confluence of the South Fork Flathead River. The lower Flathead River drainage includes those waters below the confluence of the South Fork Flathead River including Flathead Lake and those waters (where pressure was obtainable) on the Kootenai-Salish Indian reservation. The lower Missouri River drainage covers all waters below the confluence of the Marias River, while the upper Missouri River drainage incorporates the area above the Marias River, again excluding those drainages listed separately. The lower Yellowstone River drainage represents the area below the mouth of the Bighorn River while the upper Yellowstone River drainage covers the Bighorn River drainage and all waters above the confluence of the Bighorn River.

The pressure by drainage ranged from 475,170 angler days for the Upper Missouri River drainage to 775 angler days for the Little Missouri River drainage.

Table 4. Pressure in angler days by wave for the 2011 survey year.

### **3.1.2. Angler Satisfaction Ratings**

Licensed anglers fishing on Montana waters rated their fishing experience on a scale of 1 = poor to 5 = excellent for the 2011 license year. The average rating overall was 2.92 with residents and nonresidents rating their angling experience at 2.77 and 3.16 respectively (Table 6). Individual water satisfaction ratings are provided in Appendix F of this report.

Region 5 had the highest overall satisfaction rating of 3.19 while region 7 had the lowest satisfaction rating of 2.58. Nonresidents were always higher in their satisfaction ratings than residents for all regions. Angler satisfaction ratings were summarized by the twenty-two major drainages like those reported under the angling pressure section (Table 7). The ratings ranged from a high of 3.5 for the Little Missouri River drainage to a low of 2.55 for the Marias River drainage.

Table 6. - Angler satisfaction ratings by region by water type for the 2011 angling year.

### **3.1.3. Angler Crowding Ratings**

Questions were included to ask the angler to rate the crowding from one (sparse) to five (crowded) and also to ascertain how many other recreationalists they encountered for each rating category. The “Crowding Ratings” columns lists the number of responses under each rating (1-5) while the “Average Number of People Seen” columns list the average number of people seen for each of the five ratings (1-5). The ratings were summarized for the seven Fish, Wildlife & Parks regions and are listed in Table 8. The ratings were also summarized by the 22 major drainages in the state and are listed in Table 9. The crowding ratings for individual waters can be found in Appendix I of this report.

The statewide average crowding rating was 1.89 with an average of 15.16 people seen (Table 8). Region 5 had the highest crowding rating of 2.12 and Region 1 was the lowest (1.63). Region 5 had the highest average number of people seen (21.55) and Region 2 had the lowest number of people seen (10.02). The Little Missouri River drainage had the lowest crowding rating (1.0) while the Upper Yellowstone River drainage had the highest rating at 2.06 (Table 9). The Little Missouri River drainage also had the lowest number of people seen (0.67) while the Upper Missouri River drainage had the highest (23.15).

## **3.2. SUMMER (MAY-SEPTEMBER)**

### **3.2.1. Angler Pressure Estimates**

The "summer" season for angling in Montana is considered that period of the year from the first of May through the end of September. In 2011, 1,887,273 (67.4%) days of angling pressure occurred during this period (Table 10). Percentages of angling pressure taking place during the summer period within the regions ranged from 72.4% for Region 1 to 63.9% for Region 4. Pressure estimates for the summer season for individual waters are provided in Appendix B. For the top 100 waters (in terms of pressure) during the summer season, estimates for individual months are also provided in Appendix D.

Residents accounted for 66.7% of the summer angling pressure (1,258,993 angling days). Within the regions the residents comprised anywhere from as high as 89.2% of the summer angling pressure in Region 6 to as low as 45.9% of the pressure in Region 3.

Summer angling pressure by drainage (Table 11) ranged from 305,173 angler days for the Upper Missouri River drainage to 279 angler days for the Little Missouri River drainage. Angling pressure for residents by drainage ranged from a low of 28.9% for the Madison River drainage to a high of 100% for the Little Missouri River drainage.

Table 10. - Angling pressure in angler days by region by water type for the "summer" season of May 2011 through September 2011.

### **3.2.2. Angler Satisfaction Ratings**

The average rating overall for the “summer” season was 2.91 with residents and nonresidents rating their angling experience at 2.76 and 3.17 respectively (Table 12). Individual water satisfaction ratings for the summer season are given in Appendix G. Region 5 had the highest overall satisfaction rating of 3.11 while Region 7 had the lowest satisfaction rating of 2.70. Nonresidents were higher or equal in their satisfaction ratings than residents in all regions.

Angler satisfaction ratings were summarized by the twenty-two major drainages like those reported under the angling pressure section (Table 13). The ratings ranged from a high of 4.00 for the Little Missouri River drainage (with only 3 respondents) to a low of 2.47 for the Marias River drainage.

Table 12. - Angler satisfaction ratings by region by water type for the 2011 "summer" angling season of May 2011 through September 2011.

### **3.2.3. Angler Crowding Ratings**

The crowding ratings and average number of people seen were summarized for the seven Fish, Wildlife & Parks Regions for the summer season and are listed in Table 14. Region 1 had the lowest average crowding rating of 1.65, while Region 5 had the highest rating at 2.17. Region 2 had the lowest average value for the number of people seen (19.88) while Region 7 had the highest average number ((23.75). The ratings were also summarized by the 22 major drainages in the state for this same period and are listed in Table 15. The Little Missouri River drainage had the lowest average crowding rating (1.00), while the Blackfoot River drainage had the highest (2.13). The drainage with the lowest average number of people seen was the Little Missouri River drainage at 1.33 people, while the Upper Missouri River drainage had the highest number (25.81). The crowding ratings for individual waterbodies are found in Appendix J.

Table 14. - Crowding ratings summarized by region by residency by water type for the 2011 "summer" season of May 2011 through September 2011.

### **3.3. WINTER (OCTOBER-APRIL)**

#### **3.3.1. Angler Pressure Estimates**

The "winter" season for angling is from March through April and October through February of the following year. In 2011, 914,799 angler days (32.6%) of the annual fishing pressure occurred during this period (Table 16). Residents accounted for 62.1% of the total angling pressure for the winter season. Angling pressure was directed towards salmonid streams with 55.3% of total pressure, while salmonid lakes accounted for 25.5% of the use during this period. Pressure estimates for the winter season for individual waters are found in Appendix C. For the top 100 waters (in terms of pressure), the monthly pressure is also provided in Appendix E.

The pressure in the regions ranged from a high of 217,724 angler days for Region 3 to a low of 26,044 angler days for Region 7. Angling pressure by residents (as a percent of total) for this period for each FWP region ranged from a low of 41.9% for Region 5 to a high of 77.9% for Region 1. Winter angling pressure (Table 17) by drainage ranged from 181,280 angler days for the Upper Yellowstone River drainage to 495 angler days for the Little Missouri River drainage in Eastern Montana. Residents accounted for as low as 29.1% of the pressure in the Madison River drainage to a high of 100% of the pressure in the St. Mary's and Little Missouri River drainages.

Table 16. - Angling pressure in angler days by region by water type for the 2011 "winter" season of March 2011 through April 2011 and October 2011 through February 2012.

### **3.3.2. Angler Satisfaction Ratings**

The average rating overall for "winter" was 2.94 with residents and nonresidents rating their angling experience at 2.77 and 3.13 respectively (Table 18). Individual water satisfaction ratings for the winter season are given in Appendix K.

Region 5 had the highest overall satisfaction rating of 3.38 while region 1 had the lowest satisfaction rating of 2.44. Nonresidents were higher in their satisfaction ratings than residents for all regions except regions 1 and 7.

Angler satisfaction ratings were summarized by the twenty-two major drainages (Table 19). The St. Mary's Drainage had the highest rating of a 4.0 (although based on only four respondents), while the lower Flathead River drainage had the lowest rating of 2.43.

Table 18. - Angler satisfaction ratings by region by water type for the 2011 "winter" angling season March 2011 through April 2011 and October 2011 through February 2012.

### 3.3.3. Angler Crowding Ratings

The crowding ratings and average number of people seen were summarized for the seven Fish, Wildlife & Parks Regions for the "winter" season and are listed in Table 20. Region 6 had the lowest average crowding rating of 1.40, while Region 5 had the highest rating at 1.99. Region 2 had the lowest average value for the number of people seen (7.18) while Region 5 had the highest average number (19.01). The ratings were also summarized by the 22 major drainages in the state for this same period and are listed in Table 21. The Little Missouri River drainage had the lowest average crowding rating (1.00), while the St. Mary River drainage had the highest (2.00), although both of these numbers were based on 4 or less respondents. The drainage with the lowest average number of people seen was the Little Missouri River drainage at 0 people, while the Sun River drainage had the highest number (30.77). The crowding ratings for individual waterbodies are found in Appendix K.

**Table 20.** - Crowding ratings summarized by region by residency by water type for the 2011 "winter" season of March 2011 through April 2011 and October 2011 through February 2012.

## **4.0. DISCUSSION AND ANALYSIS**

### **4.1. SCOPE OF ANGLING PRESSURE**

The statewide angling pressure survey was conducted from March, 2011 through February, 2012. Estimates of pressure by residents and nonresidents were for licensed anglers only. This would encompass anglers 12 years of age and older. Spence (1971) found that the unlicensed angler (ages 2-14) comprised 9% of the pressure on Rock Creek near Missoula. Peterson (1970) found that the unlicensed angler accounted for 21% and 19% of the total number of anglers on Big Spring Creek near Lewistown during 1968 and 1969 respectively. On the Bighorn River near Hardin, Stevenson (1975) found that the unlicensed angler accounted for 14.2% and 15.8% of the total number of anglers during 1972 and 1973 respectively. Fredenberg (1984) found that 10% of the anglers on Bighorn Lake and 13% of the anglers on the Yellowtail Afterbay were unlicensed. It appears that the unlicensed angler makes up between 9% and 21% of the fishing pressure depending on the type of water being fished.

Some angling pressure was obtained on Indian reservations and National Parks within Montana. This pressure was incidental to other fishing trips and only included those anglers that had purchased a Montana fishing license. Since national parks and reservations require different licensing, a complete pressure estimate of waters within those regions was not obtained.

### **4.2. ACCURACY**

#### **4.2.1. Sampling**

Samples were drawn and questionnaires sent to the selected anglers as soon as possible. This was usually 1-2 days after the wave being sampled had ended (see discussion under Methods for details). The use of ALS allows for samples to be drawn right after the month has ended, which reduces memory bias and provides a complete coverage of the state.

#### **4.2.2. Pressure**

No significant difference was found between the survey results and on-site creel census for rivers for the statewide angling mail surveys conducted from 1982 through 1985 (McFarland, 1989). When both surveys were conducted simultaneously on lakes and reservoirs, the results again agreed (McFarland, 1989). The same methodology was used in this survey as was used in those conducted from 1982 through 1985 and in 1989 (McFarland, 1991). At the time this report was written, no published results were available for creel census conducted during the same time frame so no direct comparisons could be made.

### **4.3. RETURN RATES**

Return rates (# of respondents / [# of surveys sent – nondeliverables] \* 100) were calculated for every wave by residency. The weighted average total return rates for residents and nonresidents were 56.5% and 55.8% respectively (Table 22).

Table 22. Return rates for the 2011 statewide angling survey year by wave and by resident and nonresident.

WAVE	Total Return Rates	
	Resident	Nonresident
1	59.0	50.5
2	60.8	54.1
3	58.0	54.0
4	55.8	55.9
5	52.2	55.3
6	52.6	54.4
7	54.4	59.9
8	59.7	61.0
9	58.5	56.5
10	59.2	56.0
11	59.0	54.0
12	60.3	52.4

#### **4.4. NON-RESPONSE BIAS**

The principle measure of bias stemming from anglers failing to respond to the angler mail surveys has been the percent of anglers who said they had fished. The presumed bias is that those who had fished are more inclined to respond to a survey than those who had not fished. The consequence of such an “avidity” bias would be to inflate the angler pressure estimates. In many of the earlier surveys (1989-1995) phone surveys have been conducted concurrently with the mail surveys, with the assumption that the percent saying they had fished in a phone survey is much freer of bias than responses to a mail survey. Phone survey respondents in 1989 were 1.6 times as likely to have fished as mail survey respondents, indicating an avidity bias. Angler pressure estimates were then adjusted to correct for the avidity bias. Subsequent phone surveys in 1991-1995 did not find statistically significant differences in percent of anglers who had fished when compared to mail surveys, suggesting no avidity bias.

The quantification of non-response bias in the mail surveys is an important step when evaluating alternative survey approaches or modifications to the current approach. One way to measure non-response bias is to calculate the difference in percent of anglers fishing as measured by the initial and remail questionnaires. Presumably, if there is an avidity bias, then the percent of respondents who said they had fished would be greater on the intial mailing than those who only responded after a follow-up reminder (remail). This analysis was conducted in 1984 and it was reported that the percent who reported having fished was higher on the initial mail survey than the remail survey. For the 2011 survey, 27.8% of residents and 52.8% of non-residents responding to the initial mailing said they had fished. For those responding to the remail, 22.3% of residents and 48.8% of non-residents said they had fished. The impact of the difference between the initial and remail percentages who said they had fished is that the angler pressure estimates based solely on the initial mailing are going to be inflated relative to the estimates based on the remail or both the initial and remail responses. In 2011, this difference was very small: the statewide pressure estimate was 2.802 million using all responses, but only 1% higher based on the initial mailing (2.829 million) and 4% lower based on the remail (2.693 million).

#### **4.5. NUMBER OF LICENSED ANGLERS VS PRESSURE**

The number of resident anglers showed steady increases from 1967 to 1985 (Chart 3, Table 23). Since 1985 when there were 236,455 licensed anglers, the number has remained within 10%, reaching a low of 216,412 in 1989 and a high of 248,945 in 2009. The notable decline from 2010 (238,942) to 2011 (228,589) may be theorized to be due to stormy weather in the early summer of 2011 that kept many people indoors. Nonresident licensed angler numbers showed strong growth between 1961 and peak numbers in 2002 (Chart 3), increasing from 51,798 to 220,946 during the period. Nonresident license sales have dropped consistently between 2002 and 2011, when 126,617 anglers purchased licenses. The number of nonresident license holders has increased at a slower pace than resident license holders for the period of record. Between 1961 and 2011, the average annual rate of growth has been 1,496 nonresident anglers/year and 1,672 resident anglers/year.

Comparing statewide angling use from the mail survey versus number of anglers shows general agreement between the two variables, at least in terms of long-term trends (Charts 3 and 4). However, the ability to use these data to estimate angler pressure from license sales is limited by high variability. For the period of record, the ratio of resident angler days:licensed resident anglers has averaged 9.21, but has ranged from 13.3:1 in 1968 to 7.28:1 in 2007. Notably though, since the angler surveys have been conducted in a systematic way beginning in 1982, this variability has been much lower, with an average ratio of 8.75 and ratios ranging between 7.3 and 10.5 (83-120% of mean). The same comparison for nonresident shows considerably greater variability. Since 1982, there has been an average ratio of 4.7 angler days:licensed angler, ranging between 3.5-7.7 (74-164% of mean). If it is assumed that these ranges represent the “confidence interval” or “error” when estimating angler pressure from number of licensed anglers, we can expect that for every 100,000 licensed resident anglers, there would be an estimated 875,000 angler days (confidence interval-730,000-1,050,000). Similarly, for every 100,000 nonresident licensed anglers, there would be 470,000 angler days (confidence interval 350,000-770,000).

Table 23. - Number of licensed anglers from 1982 through 2011 by residency.

## Resident Anglers vs Use

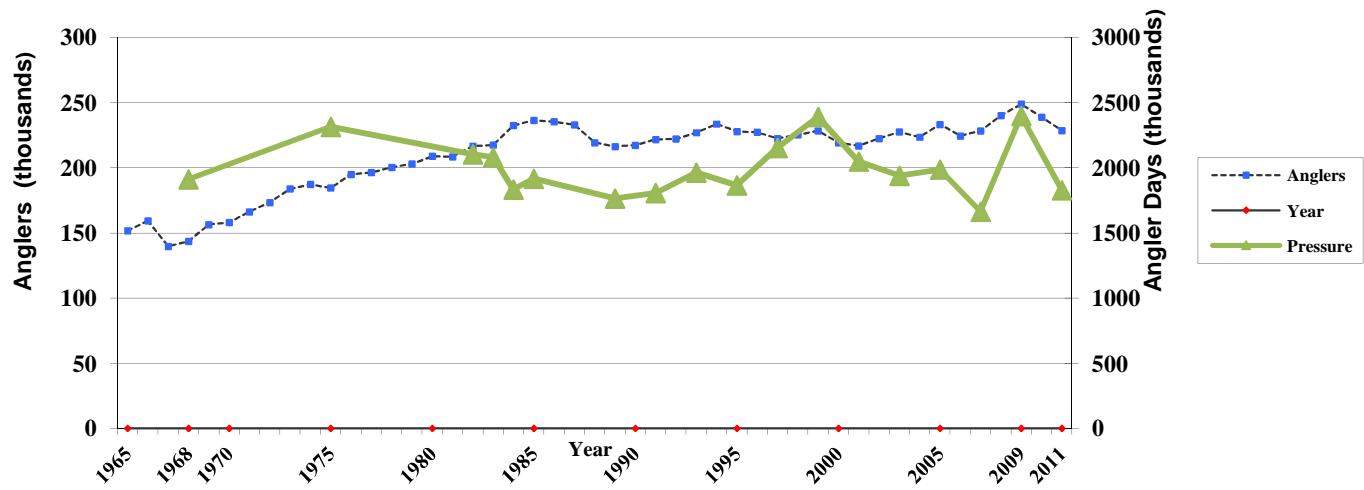

Chart 3. - Angling pressure versus number of anglers for residents from 1961 to 2011.

## Nonresident Anglers vs Use

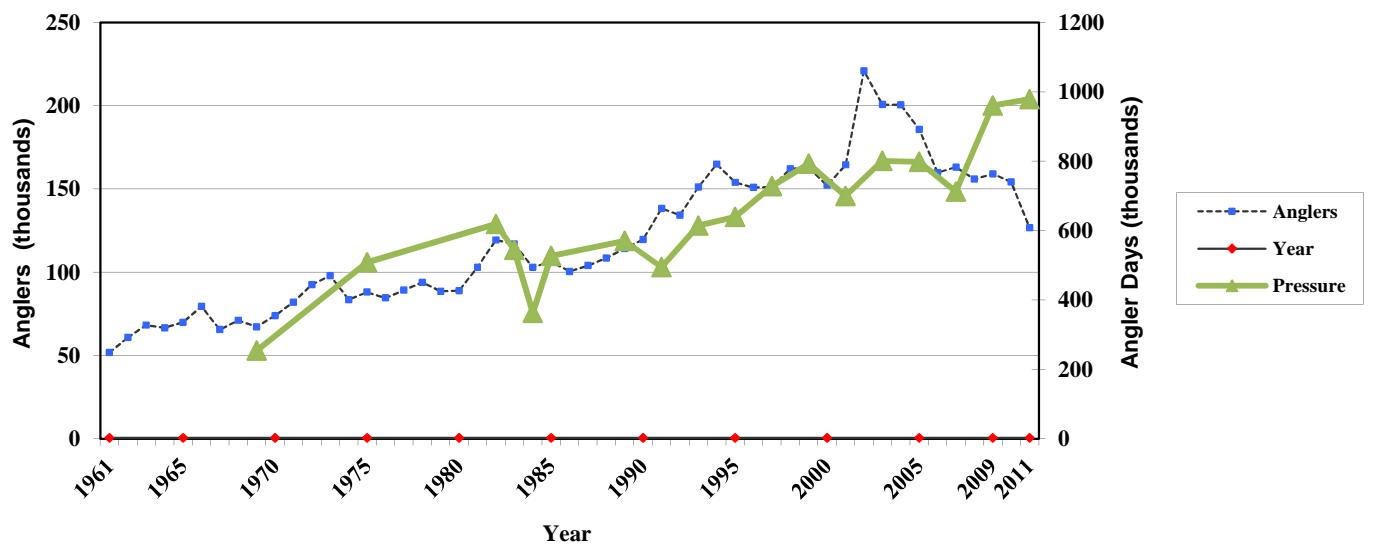

Chart 4. - Angling pressure versus number of anglers for nonresidents from 1961 to 2011.

## **4.6. COMPARISON OF ANGLER SURVEY METHODOLOGIES, 1982-2011**

An evaluation was conducted of methodologies that have been used for the angler surveys from inception (1982) through the current survey (2011) in order to better understand how changes over the years may have influenced pressure estimates and measures of bias. Characteristics of the surveys that were evaluated include: 1) types and numbers of licenses surveyed; 2) frequency of sampling license holder; 3) ratio of Resident:Non-resident sampling; 4) information sought on the questionnaire; 5) number of license holders sampled; and 6) return rate of questionnaires. These characteristics for all 16 surveys between 1982 and 2011 are listed in Table 22 and discussed below.

1. **Type of Licenses.** The number and type of licenses sold by FWP has changed over the period of time, beginning with four Resident licenses (Season, Combo, Sportsman's and Pioneer) and four Non-resident licenses (Season, Combo, Big Game, and 2-day) which were sampled from 1982 through 1985. In 1989, the four non-resident licenses remained unchanged, but for the resident licenses, the Pioneer license was dropped and Senior, Youth and Disabled licenses were added, bringing the total to six. These numbers and license types for both residents and non-residents then remained the same for the 1991-1997 surveys. In 1999 and again in 2001, there were still the same six Resident licenses, but the number of non-resident licenses increased to five with the addition of the Deer Combo license. In 2003, resident licenses increased to seven with the addition of the 2-day license; the non-resident license types increased to six with the addition of the 10-day license. This menu of licenses has remained the same for the 2003-2011 surveys. The only likely impact of these changes on pressure estimates is related to memory recall issues associated with sampling 2-day licenses in the years prior to the Automated Licensing System (ALS), as described below.

Sampling of the different license types has been done on a stratified basis, by creating different “populations” of anglers from which to draw samples. The makeup of these populations has varied over the years, but has always included resident, nonresident and short-duration (2 or 10-day) license populations. Samples are drawn randomly from each population with the amount drawn being proportionally allocated to the angling pressure each population exerted from previous surveys (see Resident:Non-resident sampling ratio section below).

2. **Frequency of sampling.** In the years before the ALS was first utilized for these surveys, it took 2-3 weeks to obtain a mailing list of eligible anglers for the first mailing of each wave. This delay may have contributed to poorer recall of events than occurred after the enactment of ALS in 2003 when mailing lists became available within 1-2 days after the end of the period of interest. Prior to ALS, it was not possible to sample 2- and 10-day permits immediately, and these were instead sampled only once toward the end of the license year, but still asking about fishing throughout the year. This undoubtedly led to inaccurate information (memory bias) because they were being asked about fishing trips for the entire license year. Once ALS was in operation, the 2- and 10-day permit holders were sampled monthly along with other permits. All other permit types (season resident and nonresident, combo, disabled, senior, etc) have been sampled on a

monthly basis since 1989. Prior to that, there was some experimentation with frequency of mailings. In 1982 and 1983, May and June were combined into one semi-monthly mailing, with all other months sampled monthly. In 1984 and 1985, the opposite approach was taken, where bimonthly mailings were used during the March-October (1984) or June-October (1985) periods, with monthly mailings for the remainder of the year.

3. **Resident:Non-resident sampling ratio.** Up through 2001, the ratio of questionnaires going to residents and nonresidents was 80:20. Results of the 2001 survey showed that nonresidents were responsible for 25.4% of the angling pressure. Accordingly, the ratio of residents:nonresidents being sampled in the survey was decreased to 75:25, and this ratio has been used through the current (2011) survey. Results from the last two surveys show an even greater percent of angling pressure coming from nonresidents: 28.9% in 2009 and 34.8% in 2011, suggesting that a change in the sampling ratio to 70:30 may be in order for the 2013 surveys. The purpose for trying to keep the sample ratio similar to the ratio of actual pressure is that it helps ensure that the residents and nonresidents are sampled in rough proportion to the angling pressure they exert, and by doing so, ensures that the accuracy of the estimates will be similar.
4. **Information sought on the questionnaires.** The information sought on the questionnaires has changed considerably over the 1982-2011 time period. However, there have been three questions in every survey—*Water fished*, *Nearest landmark*, and *Number of days fished*—which has allowed for the calculation of angler pressure on individual waters. The *Date fishing occurred* was asked on all surveys through 1995, but was dropped beginning in 1997. Surveys in 1984 and 1985 asked for the *Hours fished* and the *Number of salmon or trout caught and kept* in an attempt to calculate catch rates. This was modified slightly in 1989 to ask for the *Hours fished* and *Number of that species caught and kept*. These questions to estimate catch rates were not asked on the questionnaire after 1989. Beginning in 1984 and continuing ever since has been the inclusion of maps showing major rivers broken up by sections. Anglers have been asked to identify which section they were on when fishing. In 1984, 1985, 1989 and 1995 anglers were asked if the main purpose of their trip was to fish and to provide the round trip distance travelled. In 1984 and 1985 the angler was also asked if they stayed overnight. In 1989, anglers were asked for the first time if they were fishing primarily from a boat, shore or ice. This question was then dropped for many years but put back on the questionnaire in 2009 and 2011. Following the discovery of whirling disease, the surveys in 1995, 1997 and 1999 asked if the water anglers reported fishing on was their second choice because their first choice had whirling disease. Beginning in 1997 and extending through the 2011 survey has been a question asking what one species was the angler fishing for. Three new questions relating to the quality of the angling experience were instituted in 2001 that have been continued through 2011—*Rate your fishing on this water*, *How many other people did you see recreating on this water*, and *Rate the crowding on this water*. The surveys in 2005, 2007 and 2011 each included an additional single question that has not been asked in other surveys. In 2005, anglers were asked *Are you aware of Montana's Fish Consumption Advisories*, while in 2007 they were asked *How did you access this water?* In 2011, the unique question was *Number of days fished with an outfitter*.

5. **Number of license holders sampled.** Between 1982 and 1984, the number of questionnaires sent to anglers ranged between 20,405 and 22,521, which represented 6.1-6.7% of the number of licensed anglers. (As a point of clarification, because some anglers are surveyed more than once throughout the year in different months, the actual number of anglers contacted is slightly lower than 6.1-6.7%. This applies to the percentages described below for later surveys as well). The number of survey increased in 1985 to 44,883 which represented 13.1% of total licensed anglers. In 1989, 94,700 questionnaires were sent, which was 28.6% of licensed anglers, and is the highest percentage achieved during any survey in the 1982-2011 period. Since 1991, the number of questionnaires sent has ranged between 68,505 and 95,350, representing 18.0-26.5% of licensed anglers. In theory, years where a high percent of licensed anglers was sampled (such as 1989) should lead to more precise estimates of pressure than years with a low percent of anglers sampled (1982-1984). Such a comparison could not be conducted here, because measurements of error have not been provided in the survey reports.
6. **Return rate of questionnaires.** Typically, the return rate of questionnaires is higher on the initial mailing than after the second (remail) mailing. The numbers as displayed in Table 24 are the cumulative return rates from both mailings. Return rates in the early years of the surveys were generally much higher than in more recent years. The highest return rates were on the first survey in 1982 when 74.8% of residents and 83.5% of nonresidents responded to the questionnaires. Return rates for residents stayed above 60% for 1983 and 1984, while non-resident return rates stayed above 70%. During the 1999-2009 period, return rates were lower, but still fluctuated around 60% for both residents and non-residents. Since 2001, return rates have been fairly stable but within a range of 50-55%. This decreasing response to mail surveys is a national trend and is not unique to Montana's angler surveys (Dillman et al 2009).

There was often a wide difference in return rates between residents and non-residents (5-10%) in the years prior to use of the ALS beginning in 2003. It is reasonable to speculate that this may have been due to the fact that the 2- and 10-day non-resident questionnaires were mailed out once a year, contributing to a different behavior in respondents. Since 2003, the difference in return rates between residents and non-residents has generally been less than 2%.

#### **4.7. ERROR IN ANGLER PRESSURE ESTIMATES**

The coefficient of variation (standard error/estimate) associated with pressure estimates from 1,454 individual waters in the 2011 Angler Survey begins to increase substantially when the number of trips that make up the estimate declines below 50 (Figure 2). The scatter of the values increases as well; for estimates based on fewer than 20 trips, the CV value often reaches the maximum value of 100%. Also, when the number of trips decreases below five, the CV is almost always above 50%. Since the 95% CI is roughly twice the standard error, this means that virtually all pressure estimates based on less than five trips reported have a 95% CI at least as large as the estimate itself. For 2011, the frequency distribution of the number of trips making up the 1,454 pressure estimates is such that 400 (or 27.5%) of estimates were based on one trip, 618 (or 42.5%) were based on two trips or less, and 902 (or 62.0%) were based on 5 trips or less. This plot is useful in understanding the precision of estimates but also useful in evaluating the implications for expanding or reducing the number of questionnaires sent for the mail survey. For example, if the number of questionnaires was reduced by 50%, then for those waters that reported two trips in 2011 would likely report one trip instead. Those that received one trip in 2011 would likely receive no trips under this 50% reduction scenario, meaning that about 400 waters would be lost and not receive a pressure estimate from such a survey.

Pressure estimates based on one trip however are almost always less than 200 angler-days, meaning that the information that would be lost is for waters that currently receive very light pressure. At the other end of the scale, the 111 waters in 2011 which had pressure estimates based on 100 trips or more, would receive on average only 50 trips in this new scenario. The CV values for these waters would increase from a range of 15-30% to 20-40%.

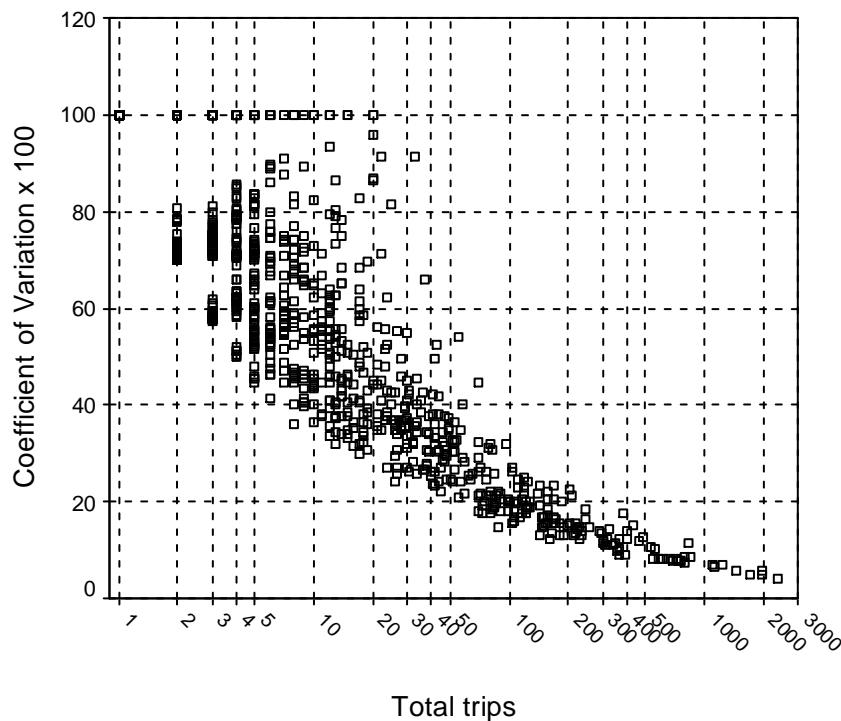

Figure 2. Coefficient of variation versus total number of trips for 2011 angler survey.

#### **4.8. CROWDING, SATISFACTION AND NUMBER PEOPLE SEEN**

Since 2001, three related questions have been on the survey questionnaire: 1) Rate your fishing on this water, 2) How many other people did you see recreating on this water? and 3) Rate the crowding on this water. An analysis of the results from the 2011 survey show that there is a positive relationship between number of people seen and crowding (Figure 3). However, there is considerable overlap of the number of people seen among the crowding categories, something expected given the subjective nature of what the term “crowding” means to individual anglers. The number of people seen or crowding was not related to the satisfaction rating however (Figures 4 and 5), and if anything satisfaction seemed to slightly higher at intermediate levels of crowding (2-4).

A more likely explanation for the great variation in levels of satisfaction reported is related to the fishing experience itself. Support for this comes from a previous survey (Frazer and Brooks 1997) on the Bighorn River in 1992-1993. In that study, the authors found a strong positive relationship between how anglers rated their fishing experience and the number of trout they reported to have caught. Their study also found no relationship between number of anglers/boats seen and the rating of the fishing experience, but did find a relationship between the perceived sense of crowding and the actual number of anglers and boats seen.

Based on the results of the Bighorn study, it is reasonable to expect that trends in satisfaction scores from the statewide mail survey will be related, at least in part, to quality of the fishing experience, as measured by catch rates or size of fish. To test this hypothesis, changes in satisfaction rates were evaluated relative to changes in walleye fishing at Tiber Reservoir. For the creel conducted annually between Memorial Day and Labor Day, the average size of walleye in the creel has increased from 13.2 inches in 2001 to 16.2 inches in 2011. Catch rates did decrease slightly between these two years, dropping from 0.46 walleye/hour in 2001 down to 0.36/hour in 2011. However, the satisfaction rating for those who listed walleye as their primary fish for June, July and August was 2.09 in 2001 (n=61) and increased to 2.42 in 2011 (n=19). These results would suggest that satisfaction ratings may be reflecting increased satisfaction associated with the larger walleye in the creel. Worth noting is that the sample size in 2011 was small (n=19), during a year when Tiber Reservoir received 2,861 angler days during the summer season. The implication of this is that an adequate sample size to make reliable comparisons of creel statistics and angler satisfaction may only be expected on relatively heavily fished waters.

A similar analysis was conducted on satisfaction rates relative to changes in catch rates for yellow perch on Canyon Ferry Reservoir. Creel surveys which are conducted annually were compared to satisfaction rates during the winter season for anglers who indicated that perch were the primary species they sought. In 2003-2004, the average catch rate for yellow perch was 2.3 fish/hr and the average satisfaction rate was 2.13 (n=39). In 2011-2012, the average catch rate had dropped to 0.59 fish/hr while the satisfaction rate had actually risen to 2.27 (n=22). A complicating aspect of this analysis may be that the size of the fish was smaller in 2004. The average size of yellow perch caught in summer gill nets in 2003 and 2004 was 6.7 inches, while the average for perch caught in gill nets in 2011 and 2012 was 8.55 inches. Assuming the gill net catches reflected sizes in the creel, the increased size of fish in 2012 relative to 2004 may have compensated for the lower catch rates, leading to the slight increase in satisfaction rates.

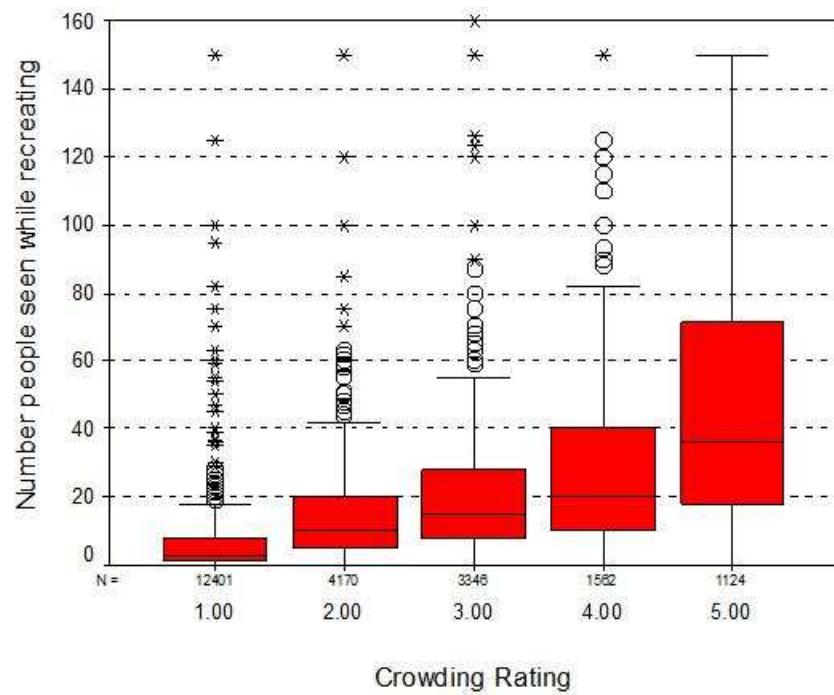

Figure 3. Relationship between crowding ratings and number of people seen for 2011 survey. Horizontal line within boxes represent median value, upper and lower box margins represent 25-75% of samples, error bars represent 95% of samples, and 0s and Xs represent outliers.

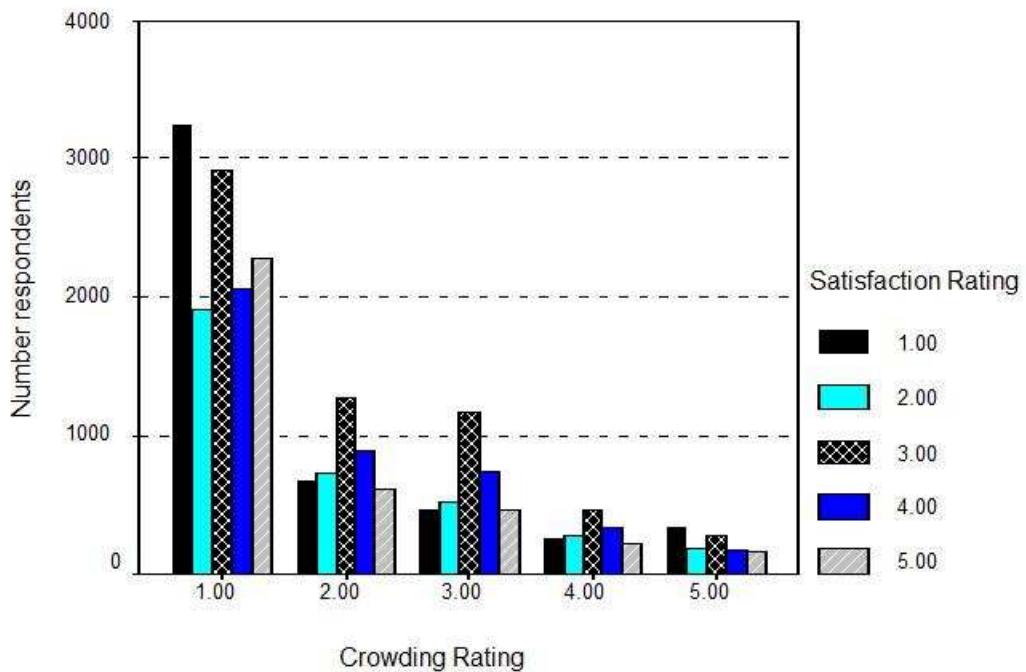

Figure 5. Relationship between crowding ratings and satisfaction ratings for 2011 survey.

#### **4.9. RIVER/LAKE ACCESS ANALYSIS**

On the questionnaire, anglers were asked if they had mostly fished from shore, boat, both shore and boat, or ice. When considered on a drainage basis (Table 25), the Lower Flathead had the lowest percentage (28.9%) fishing from shore and the highest percent fishing from boats (55.9%). Conversely, the Gallatin River drainage had the most fishing from shore (90.4%) and the least fishing from a boat (5.3%). For ice fishing, the drainage with the least was the Bitterroot River drainage (0.4%), while the St. Mary's drainage had the highest percentage of angler days spent fishing through the ice (17.4%).

Region 6 had the lowest percentage of anglers fishing from shore (34.7%) while Region 3 had the greatest percent (61.2%)(Table 26). In terms of fishing from a boat, Region 2 was lowest (29.2%), while Regions 1 and 6 were highest at 50.0%. Region 5 had the lowest level of ice anglers (0.6%), while Region 7 had the highest level (8.9%). Residents were more likely to fish from shore (53.4%) than were non-residents (48.8%)(Table 27). Nonresidents were only slightly more likely to fish from a boat (36.3%) than residents (35.7%), and were also slightly more likely to fish from both a boat and shore (9.6%) than residents (6.8%). Table 28 provides percentage of anglers accessing the water by each of these types for individual waterbodies.

#### **4.10. OUTFITTER USAGE ANALYSIS**

A new question on the 2011 survey was how many days the angler fished with an outfitter. Results are shown in Table 29 for those waters with five or more total days of angling. Use of an outfitter was typically higher on rivers/streams than on lakes. For lakes, the highest use of outfitters on a water that receives substantial fishing pressure was Flathead Lake which had an outfitter usage rate of 8.38%. The highest outfitter usage for a major river was the Bighorn River, where between 36.3-38.4% of anglers used an outfitter on all three sections of the river. The range of outfitter usage for other major rivers included the Backfoot River (11.5-18.8%), the Madison River (11.2-20.8%), the Missouri River (4.7-29.0%), and the Yellowstone River (0.5-26.4%). The division of the major rivers into numerous sections allows for identification and quantification of areas where outfitting is highest. On the Yellowstone River for example, outfitting usage downstream of Reedpoint is 3.6% or lower, whereas between Livingston and Reedpoint it is at its highest (22.8-26.4%). Usage upstream of Livingston to Tom Minor Creek is still high, in the 13.7-14.5% range. Above Tom Minor Creek, the usage drops considerably to 3.7%.

**Table 29. Percentage of Days Fished with an Outfitter  
for Individual Waters, March 2011–February 2012.**  
**Only waters with five or more total trips are included.**

## **5.0. CONCLUSIONS AND RECOMMENDATIONS**

The statewide angling pressure mail survey continues to provide valuable data on individual bodies of water as well as statewide estimates. The survey also provides a basis for angler satisfaction on individual water bodies. With time, this data can be a valuable tool to aid fisheries managers in assessing the public perception on how well they are doing managing individual waters. The survey provides a trend basis for crowding on the more popular waters in the state. The survey also provides a means to survey anglers on a year long basis about a topic of interest for that year.

The stable response rate to the questionnaires in the past 10 years may be interpreted to suggest that the mail survey has become recognized and accepted by both resident and nonresident anglers. Assuming this reflects a level of trust on the part of the angling public, it suggests that FWP should be cautious about discontinuing the survey or moving away from the mail survey format. Within this context is the need to seek greater budgetary efficiencies in future surveys. Options to be evaluated include reducing the frequency of the survey (e.g. going to a 3 or 4 year survey cycle), reducing the number of questionnaires mailed, or using online surveys as a way to gather additional responses. A phone survey should be conducted within the next few cycles as well to ascertain the non-response bias if any.

## **7.0. EXAMPLES OF QUESTIONNAIRES**

The August 2011 questionnaire is an example of an initial mail form, while the February 2012 questionnaire is an example of a re-mail form.

# Montana Fish, Wildlife & Parks

AUGUST 2011

Dear Angler,

*please cut along dotted line and return bottom portion*

We are conducting a monthly survey sent to a random sample of fishing license holders. This survey provides important data to help determine fishing pressure on the lakes and streams of Montana. By providing us with this vital information, you will be assisting us in managing Montana's fish population.

This survey requests only **YOUR** fishing activities. Include **ALL** waters fished during the month of **AUGUST 2011**. If you fished one of the rivers on the back of this form, please include the section number to aid us in identifying the portion of the river. We appreciate your cooperation in returning this survey, even if you did not fish.

**\*\*EVEN IF YOU DID NOT FISH OR CATCH ANY FISH, PLEASE FILL OUT AND RETURN THIS QUESTIONNAIRE\*\***

Did you fish in Montana during the month of **AUGUST 2011?**

**YES** - Total number of days fished \_\_\_\_\_. Please continue below.

**NO** - Thank you - please return the survey.

*Prompt return is appreciated. We send reminders to those who have not returned this within a few weeks. Thank you!*

**\*\*PLEASE ENTER EACH WATER YOU FISHED. (YOUR fishing only)\*\***

Name of Lake or Stream Fished	Section number if it applies (See maps on back)	Nearest Town or County	Number of Days FISHED in AUGUST only	Number of Days FISHED With an OUTFITTER in AUGUST only	Rate your FISHING on this water: 5 = excellent to 1 = poor	How many other people PER DAY did you see recreating on this water?	Rate the CROWDING on this water: 5 = very crowded to 1 = not at all crowded	What ONE fish species did you primarily fish for?	Most of your fishing on this water by? 1- Shore 2- Boat 3- Both 4- Ice

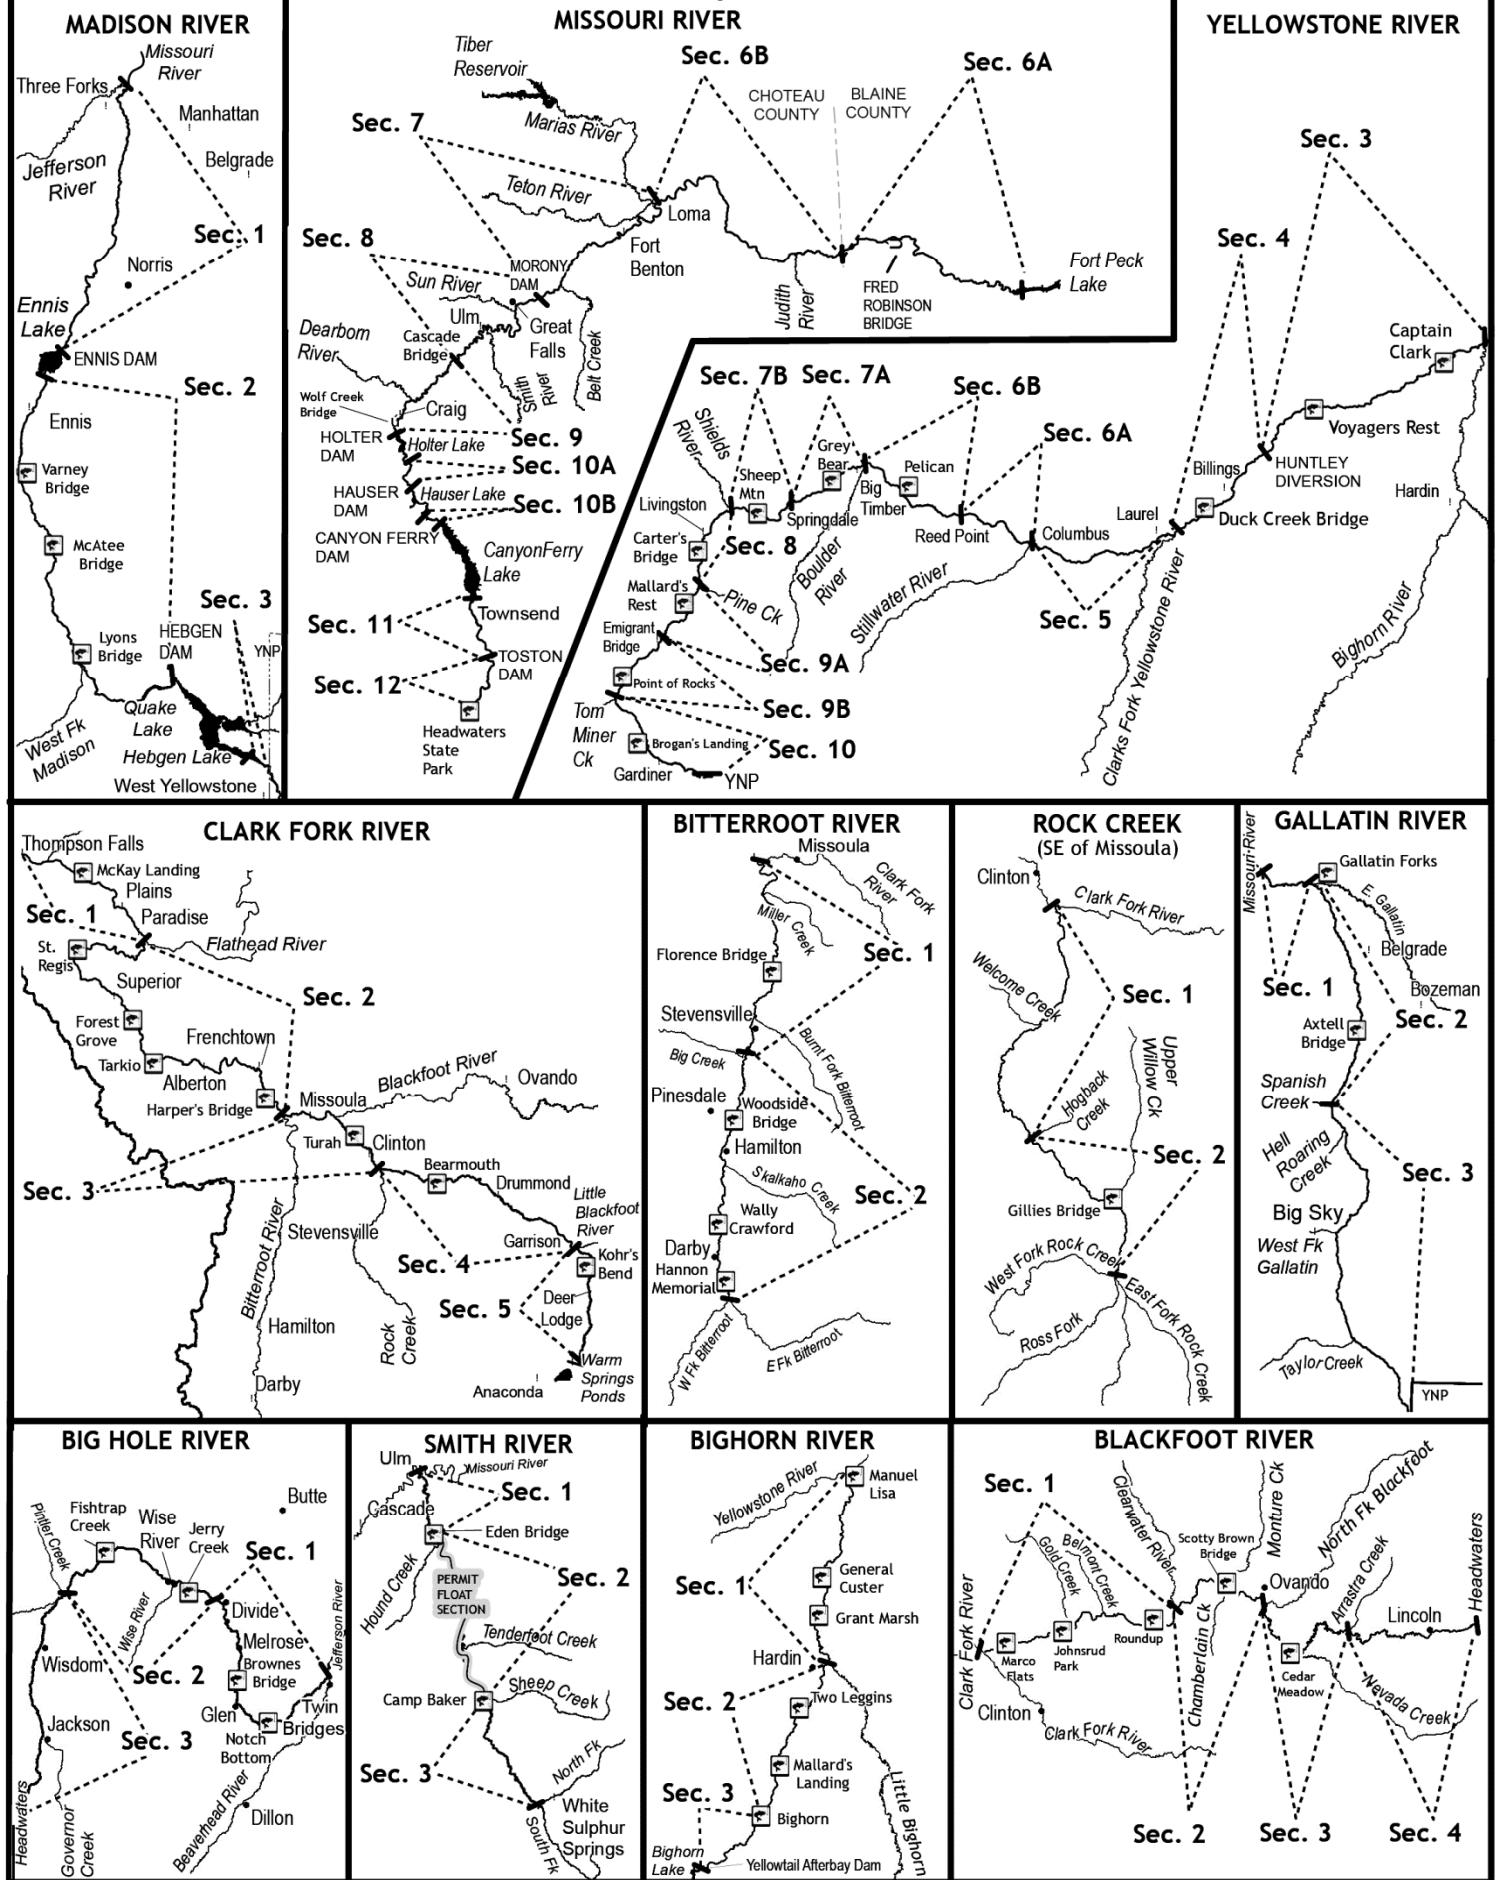

**Thank you for your time.**

We need information on all waters fished in Montana, not just the waters included on these maps.  
Please use the maps below to find river sections for commonly fished waterbodies.

For waters other than those indicated on a map, please be very specific as to name, nearby towns, access points, or tributaries.

MISSOURI RIVER

# Montana Fish, Wildlife & Parks

FEBRUARY 2012

We recently mailed you a request for information on your **FEBRUARY** fishing in Montana. If you returned the survey and our mail crossed paths, **thank you** for participating in our survey and please disregard this second request. If you have not mailed in your survey, please take a moment to complete this questionnaire and return it in the provided envelope. We appreciate your time!

Dear Angler,

*please cut along dotted line and return bottom portion*

As you may recall, we are conducting a monthly survey sent to a random sample of fishing license holders. This survey provides important data to help determine fishing pressure on the lakes and streams of Montana. By providing us with this vital information, you will be assisting us in managing Montana's fish population.

This survey requests only **YOUR** fishing activities. Include **ALL** waters fished during the month of **FEBRUARY 2012**. If you fished one of the rivers on the back of this form, please include the section number to aid us in identifying the portion of the river. We appreciate your cooperation in returning this survey, even if you did not fish.

**\*\*EVEN IF YOU DID NOT FISH OR CATCH ANY FISH, PLEASE FILL OUT AND RETURN THIS QUESTIONNAIRE\*\***

Did you fish in Montana during the month of **FEBRUARY 2012?**  **YES** - Total number of days fished \_\_\_\_\_. Please continue below.  
 **NO** - Thank you - please return the survey.
